

Pembrolizumab for Recurrent Locally Advanced and/or Metastatic Gastric/ Gastroesophageal (GEJ) Cancer

An HCP Tool From the IO Essentials Initiative

Programmed death receptor (PD-1) is a receptor found on T cells and acts as a negative regulator of T-cell activation and proliferation, meaning it “turns the immune system off,” essentially acting as a brake. This type of inhibitory role is necessary to prevent excessive immune reactions and autoimmunity. For this reason, PD-1 and other regulators acting in this manner are known as immune checkpoints.

Programmed death ligand-1 (PDL-1) is an immunosuppressive molecule that is expressed on the surface of non-cancerous cells, which interacts with PD-1 to prevent autoimmune reactions. However, exploitation of the PD-1/PDL-1 pathway is one mechanism cancer cells have pathologically capitalized on to avoid immune detection. By expressing PDL-1 on their cell surface, cancer cells can go undetected by the immune system.

Pembrolizumab (Keytruda®) is an anti-programmed death receptor (PD-1) monoclonal antibody checkpoint inhibitor. Pembrolizumab selectively binds to PD-1, blocking the PD-1/PDL-1 interaction, thereby “exposing” cancer cells and “turning on” the immune system.

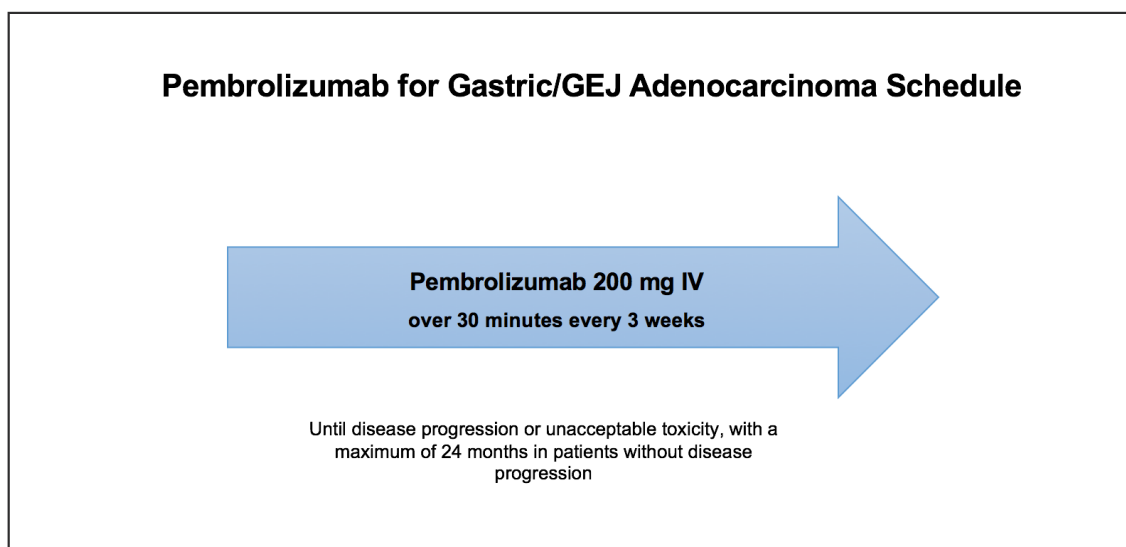

Approximately 52% of gastric/gastroesophageal junction (GEJ) adenocarcinomas express PDL-1. The approval of pembrolizumab in locally advanced and/or metastatic gastric and GEJ adenocarcinoma was based on data demonstrating sustained both partial and complete disease response rates in PDL-1-expressing tumors in patients who had disease progression on or after 2 or more prior systemic chemotherapy regimens.

Pembrolizumab is indicated as monotherapy for the treatment of locally advanced and/or metastatic PDL-1-expressing gastric/GEJ adenocarcinoma that has progressed on or after 2 or more therapies, including fluoropyrimidine- and platinum-containing chemotherapy, and if indicated, HER2-targeted therapy.

This document is part of an overall HCP toolkit intended to assist providers in optimizing management of locally advanced and/or metastatic gastric and GE junction PDL-1-expressing cancer in patients receiving pembrolizumab.

DRUG DOSAGE/ADMINISTRATION

- For recurrent, locally advanced and/or metastatic PD-L1 expressing gastric/GEJ adenocarcinoma, the recommended dosage of pembrolizumab (Keytruda®) is 200 mg administered as an intravenous infusion over 30 minutes every 3 weeks until disease progression, unacceptable toxicity, or up to 24 months in patients without evidence of disease progression

- Pembrolizumab solution is clear to slightly opalescent, colorless to slightly yellow. Discard the vial if visible particles are observed
- Pembrolizumab is provided as a 50 mg lyophilized powder in a single-dose vial for reconstitution or as a 100 mg/4 mL (25 mg/mL) solution in a single-dose vial. When reconstituting pembrolizumab for injection, slowly swirl the vial. Do NOT shake the vial
- Pembrolizumab is classified as an irritant and may be safely administered via a central or peripheral line. It is important to assure IV access before administration. Pembrolizumab should be administered through an intravenous line containing a sterile, non-pyrogenic, low-protein-binding in-line or add-on filter (pore size of 0.2 – 5 micrometers). Do not coadminister pembrolizumab with other drugs through the same intravenous line

SIDE EFFECTS AND THEIR MANAGEMENT

Because pembrolizumab is an immunotherapy that works by enhancing the patient’s immune system, most adverse reactions associated with pembrolizumab are related to overactivity of the patient’s immune system (ie, immune-related adverse events [irAEs]). Various organ systems (often more than one) or tissues may be affected.

- Keys to toxicity management:
 - » Proactive assessment for early signs/symptoms of toxicity
 - » Prompt intervention
 - » irAEs are typically managed with treatment interruption and selective use of corticosteroids
 - » In rare instances, toxicity may be steroid refractory, and additional immunosuppressive agents may be necessary (infliximab, mycophenolate mofetil, cyclophosphamide, etc)
 - » Pembrolizumab will likely be held or discontinued depending on severity and/or persistence
 - » Referral to organ specialist should be considered, given that unique testing and management strategies may be required
- irAEs associated with pembrolizumab treatment can be categorized into those that are most common, less common but serious, and others that are easily overlooked. (Table 1; Appendix 1). Other adverse events associated with pembrolizumab therapy are listed in Appendix 2

Table 1. Care Step Pathways for the management of immune-related AEs associated with pembrolizumab monotherapy.

irAE category	Examples	Location
Most common	Skin toxicities (pruritis, rash, etc) Gastrointestinal toxicity: Diarrhea and colitis Thyroiditis Hepatic toxicities	Appendix 1
Less common but serious	Additional endocrinopathies - Hypophysitis (pituitary) - Adrenal insufficiency (adrenalitis) - Diabetes Pneumonitis	Appendix 1
Easily overlooked	Arthralgia/arthritis Mucositis/xerostomia Neuropathy Nephritis	Appendix 1

CLINICAL PEARLS

- It is important to monitor laboratory values at the start of treatment, periodically during treatment, and as indicated clinically. Laboratory values commonly monitored include: CBC w/ differential, creatinine, alkaline phosphatase, AST/ALT, bilirubin (direct/total), sodium, potassium, calcium, magnesium, thyroid function, and glucose. Please see the individual irAE CSPs for more detail about specific laboratory monitoring
- PD-L1 status or elevated expression is a prerequisite for pembrolizumab treatment of locally recurrent and/or metastatic gastric/GEJ adenocarcinoma, as it is in lung cancer
- Pembrolizumab-related irAEs may occur at any time, including after treatment completion or discontinuation
- IrAEs have different time courses. New irAEs may become apparent upon tapering of corticosteroids used to treat an earlier onset irAE, since the new irAE can be suppressed or masked by immunosuppressive therapy. Therefore, during the taper period, patients should be advised to be on the lookout for early signs of new irAEs as well as recurrence of the original irAE that was being treated
- Patients sometimes experience signs/symptoms that they think are due to “flu” or a cold, but that actually represent an irAE or an infusion reaction
- Endocrinopathies often present with vague symptoms (fatigue, headache, and/or depression) that can easily be overlooked or initially misdiagnosed. Hypervigilance and follow-up is important on the part of both HCPs and patients
- Unlike other irAEs, endocrinopathies usually do not resolve and may require lifelong hormone replacement therapy
- HCPs should encourage patients to carry information about their pembrolizumab regimen with them at all times. This might be the pembrolizumab-specific wallet card, or at least emergency phone numbers and the side effects associated with the regimen. You may suggest that they paperclip the wallet and insurance cards together so information about their regimen will be shared whenever they show the insurance card

QUESTIONS & ANSWERS

Q. Is the testing for PD-L1 expression the same as it is in lung cancer?

A. An FDA-approved test is required, but PD-L1 is measured and reported differently in gastric or GEJ cancer versus lung cancer. For gastric or GEJ cancer, the combined positive score (CPS) is required, which evaluates the number of PD-L1 staining cells (tumor cells & associated immune cells) relative to viable tumor cells. For lung cancer, only the tumor proportion score is reported. This evaluates the percentage of viable tumor cells showing partial or complete membrane staining at any intensity. A CPS ≥ 1 is considered a positive PD-L1 test.

Q. How long will patients stay on pembrolizumab?

A. The prescribing information indicates until disease progression or unacceptable toxicity, with a maximum of 24 months in patients without disease progression. The interpretation of these criteria varies from institution to institution and from provider to provider.

Q. Are there standard dosage reductions for irAEs associated with pembrolizumab?

A. There are no dosage reductions for irAEs associated with pembrolizumab. The dose is either held until the irAE resolves sufficiently (typically to Grade 0 or Grade 1) or, if the irAE is severe enough, pembrolizumab is discontinued permanently.

Q. I have experience using pembrolizumab for lung cancer. Is the safety profile different in those patients vs gastric/GEJ adenocarcinoma patients?

A. Generally, the safety profile of pembrolizumab is similar across tumor types. However, the context may be different—patients with other tumor types may have differing comorbidities or underlying organ dysfunction. For example, lung cancer patients may have underlying lung disease that will exacerbate shortness of breath associated with pneumonitis.

QUESTIONS & ANSWERS

Continued

Q. How do I counsel my patients about immunizations?

A. That's a logical question, given that the checkpoint inhibitors alter the immune response. Advise your patients not to receive live vaccines (eg, measles, mumps, and rubella and the varicella vaccine [Zostavax[®]]) because they have not been evaluated in this setting. The use of attenuated vaccines has been and continues to be evaluated. Counsel patients to discuss all immunizations with the oncology team prior to administration so the benefits and risks can be weighed on an individual basis. For example, SHINGRIX[®], approved in 2017, is an attenuated (non-live) varicella vaccine; its use can be discussed with the oncology team if a recommendation is being made for the patient to receive the injection series. Annual influenza vaccination with the inactivated influenza vaccine is recommended. The nasal spray flu vaccine is a live attenuated influenza vaccine and should not be administered to patients treated with immune checkpoint inhibitors.

Q. What are the differences between oxaliplatin-induced peripheral neuropathy (PN) and nerve problems seen with pembrolizumab?

A. Oxaliplatin PN tends to happen on the hands and feet with tingling and numbness. Pembrolizumab-induced nerve problems manifest as weakness or trouble walking, but they can also manifest with worsening numbness/tingling/functional impairment. Although rare, there have been cases reported of Guillain-Barré syndrome and myasthenia gravis. It is important to hold treatment with pembrolizumab for moderate to severe neurologic symptoms until etiology has been determined. It is imperative to ascertain baseline neurological deficits prior to initiating pembrolizumab for appropriate evaluation of worsening symptoms.

APPENDIX 2

Management of other AEs associated with pembrolizumab monotherapy

Adverse event	Common symptoms	Common management/anticipatory guidance
Anorexia	Decreased appetite	<ul style="list-style-type: none"> • Monitor weight; query patient about appetite/eating habits; advise dietary modification if necessary (should improve with time) • Anticipate standard dose holds/discontinuations* • Consider referral to nutrition services for counseling on best food choices to avoid excessive weight loss
Constipation/ abdominal pain	Infrequent stools/ difficulty stooling, abdominal pain	<ul style="list-style-type: none"> • Consider other causes, such as opioid-induced constipation • Increase fluid, fiber; use laxatives with caution; suggest stool softeners and physical activity • Consider appropriate testing to evaluate bowel obstruction • Anticipate standard dose holds/discontinuations* for Grade 3 and Grade 4 (constipation with manual evacuation indicated, severe abdominal pain, or life-threatening consequences)
Embryo-fetal toxicity	—	<ul style="list-style-type: none"> • Advise of risk to fetus and recommend use of effective contraception during treatment and for 4 months after pembrolizumab is discontinued • Advise patients to tell their HCPs immediately if they or their partners suspect they are pregnant while taking therapy
Encephalitis	Headache, fever, tiredness, confusion, memory problems, sleepiness, hallucinations, seizures, stiff neck	<ul style="list-style-type: none"> • New-onset, moderate-to-severe symptoms: rule out infectious or other causes • Counsel neurologist, obtain brain MRI, and lumbar puncture • Anticipate standard dose-holds and discontinuations*
Fatigue	Feeling tired; lack of energy	<ul style="list-style-type: none"> • Query patients regarding energy level; evaluate possible contributory factors, including infection, disease progression, and hematological and metabolic abnormalities; standard supportive care • Anticipate standard dose holds/discontinuations* • Fatigue that interferes with ADLs is concerning and should be evaluated for underlying causes, such as possible endocrinopathy
Headache	Head pain	<ul style="list-style-type: none"> • Need to rule out brain metastases, encephalitis, or hypophysitis; otherwise, standard supportive care (should improve with time) • Headache occurring in conjunction with fatigue could be indicative of hypophysitis; obtain MRI of brain with pituitary slices/pituitary protocol to confirm/rule out • Anticipate standard dose holds/discontinuations*

Management of other AEs associated with pembrolizumab monotherapy

(Continued)

Adverse event	Common symptoms	Common management/anticipatory guidance
Infusion reaction	Chills/shaking, back pain, itching, flushing, difficulty breathing, hypotension, fever	<ul style="list-style-type: none"> Monitor patients for signs and symptoms. For grade 3 or 4 reactions: stop infusion and permanently discontinue pembrolizumab
Insomnia	Difficulty falling or staying asleep	<ul style="list-style-type: none"> Counsel patients on good sleep habits; prescription medications can be used if needed (should improve over time) Anticipate standard dose holds/discontinuations*
Myocarditis	Shortness of breath; arrhythmia; light-headedness; chest pain; fatigue; nausea; edema	<ul style="list-style-type: none"> Obtain baseline ECG Assess cardiac biomarkers (BNP; troponin) Control cardiac diseases (and risk factors) optimally Consult cardiologist and consider corticosteroids if myocarditis is suspected Add additional immunosuppressive agents in severe, refractory cases Institute standard dose holds/discontinuations (in consultation with cardiologist)
Nausea/vomiting	Vomiting, queasiness, RUQ or LUQ pain	<ul style="list-style-type: none"> Rule out brain metastases and gastroenteritis Provide standard supportive care, since it is adequate in most cases Check LFTs/lipase/amylase if hepatotoxicity or pancreatitis are suspected Anticipate standard dose holds/discontinuations*
Upper respiratory tract infection	Cough, runny nose, sore throat, nasal congestion	<ul style="list-style-type: none"> Evaluate potential causes—a dry cough and shortness of breath would increase concern for pneumonitis Standard supportive care Anticipate standard treatment holds*
Vision changes	Eye redness, pain, blurred vision, photophobia	<ul style="list-style-type: none"> Test and evaluate for uveitis and episcleritis (by ophthalmologist, preferably) Urgency of ophthalmology referral increases with grade G1: continue immunotherapy, use artificial tears G2: hold immunotherapy; ophthalmic and systemic corticosteroids (under ophthalmologist guidance) G3 or G4: permanently discontinue immunotherapy; treatment by ophthalmologist to include ophthalmic and systemic corticosteroids

*Withhold pembrolizumab for any Grade 3 (severe) AE. Permanently discontinue for any Grade 4 (life-threatening) AE, persistent Grade 2–3 AE, any severe (Grade 3) AE that recurs, or when ≥ 10 mg/d prednisone or equivalent is required for 12 weeks. Resume treatment when AE returns to Grade 0 or 1.
